Getting to the right solution through a modular system

MultiZack® - brush solutions for numerous industrial applications

(Burgwald). No matter if it is cleaning, washing, polishing, deburring, peeling, Osborn's MultiZack® brush system solves many challenges: oiling, moistening and dedusting, transporting, guiding, dividing, sorting, dosing or positioning. With its variable and modular design, individual brush segments can be combined and mounted on to a shaft to form a rollerbrush with working widths of more than 800 mm. MultiZack® can be used for a wide range of purposes in various industrial environments.

Seven standard brush bodies with a body diameter of 31 mm to 125 mm are available in the modular system. By mounting several brush segments of the same body diameter on one shaft, rollerbrushes of different lengths (working widths) can be created.

The fill materials, fill density and fill pattern can be determined individually. The most frequently used fill material is synthetic bristles. Alternatively, abrasive nylon, natural hair, plant fibres or wires can be used to suit the respective application.

Maintenance is easy for the user: In case of partial wear of certain areas, only individual brush segments can be replaced instead of replacing the complete roller. The replacement can be carried out by the user himself with little effort. It is not necessary to send the complete shaft to the manufacturer for replacement.

The infinite combination possibilities of the system make MultiZack® the ideal solution for many tasks in industrial production and further processing.

###

About OSBORN

OSBORN manufactures tools and application solutions for mechanical surface treatment and surface finishing. Production sites and sales organizations in 13 countries serve markets in 120 countries. Besides 10,000 standard products OSBORN has developed more than 100,000 tailor-made application solutions for customers in industry and trade. The portfolio includes technical brushes, roller brushes, polishing and grinding tools, polishing emulsions and solid compounds as well as idler rollers and matching rails.
